## Question 1

Correct

Marked out of 5.00

Create a base class Shape with a method called calculateArea(). Create three subclasses: Circle, Rectangle, and Triangle. Override the calculateArea() method in each subclass to calculate and return the shape's area.

In the given exercise, here is a simple diagram illustrating polymorphism implementation:

```

abstract class Shape {
    public abstract double calculateArea() ;
}
  
```

```
System.out.printf("Area of a Triangle :%.2f\n",((0.5)*base*height)); // use this statement
```

sample Input :

```

4 // radius of the circle to calculate area PI*r*r
5 // length of the rectangle
6 // breadth of the rectangle to calculate the area of a rectangle
4 // base of the triangle
3 // height of the triangle
  
```

**OUTPUT:**

**Area of a circle :50.27**

**Area of a Rectangle :30.00**

**Area of a Triangle :6.00**

**For example:**

Test	Input	Result
1	4 5 6 4 3	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00
2	7 4.5 6.5 2.4 3.6	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32

**Answer:** (penalty regime: 0 %)

```

17     }
18 }
19
20 class Rectangle extends Shape {
21     private double length;
22     private double breadth;
23
24     public Rectangle(double length, double breadth) {
25         this.length = length;
26         this.breadth = breadth;
27     }
28
  
```

```

29     @Override
30     public double calculateArea() {
31         return length * breadth;
32     }
33 }
34
35 class Triangle extends Shape {
36     private double base;
37     private double height;
38
39     public Triangle(double base, double height) {
40         this.base = base;
41         this.height = height;
42     }
43
44     @Override
45     public double calculateArea() {
46         return 0.5 * base * height;
47     }
48 }
49
50 public class Main {
51     public static void main(String[] args) {
52         Scanner scanner = new Scanner(System.in);
53
54         double radius = scanner.nextDouble();
55         Circle circle = new Circle(radius);
56         System.out.printf("Area of a circle: %.2f\n", circle.calculateArea());
57
58         double length = scanner.nextDouble();
59         double breadth = scanner.nextDouble();
60         Rectangle rectangle = new Rectangle(length, breadth);
61         System.out.printf("Area of a Rectangle: %.2f\n", rectangle.calculateArea());
62
63         double base = scanner.nextDouble();
64         double height = scanner.nextDouble();
65         Triangle triangle = new Triangle(base, height);
66         System.out.printf("Area of a Triangle: %.2f\n", triangle.calculateArea());
67     }
68 }

```

	Test	Input	Expected	Got	
✓	1	4 5 6 4 3	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00	✓
✓	2	7 4.5 6.5 2.4 3.6	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32	✓

## Question 2

Correct

Marked out of 5.00

## 1. Final Variable:

- Once a variable is declared **final**, its value cannot be changed after it is initialized.
- It must be initialized when it is declared or in the constructor if it's not initialized at declaration.
- It can be used to define constants

```
final int MAX_SPEED = 120; // Constant value, cannot be changed
```

## 2. Final Method:

- A method declared **final** cannot be overridden by subclasses.
- It is used to prevent modification of the method's behavior in derived classes.

```
public final void display() {  
    System.out.println("This is a final method.");  
}
```

## 3. Final Class:

- A class declared as **final** cannot be subclassed (i.e., no other class can inherit from it).
- It is used to prevent a class from being extended and modified.
- public final class Vehicle {  
 // class code  
}

Given a Java Program that contains the bug in it, your task is to clear the bug to the output.

you should delete any piece of code.

For example:

Test	Result
1	The maximum speed is: 120 km/h This is a subclass of FinalExample.

Answer: (penalty regime: 0 %)

Reset answer

```
1 class FinalExample {  
2  
3     int maxSpeed = 120;  
4  
5     public final void displayMaxSpeed() {  
6         System.out.println("The maximum speed is: " + maxSpeed + " km/h");  
7     }  
8 }  
9  
10 class SubClass extends FinalExample {  
11  
12  
13  
14     public void showDetails() {  
15         System.out.println("This is a subclass of FinalExample.");  
16     }  
17 }  
18  
19 class prog {  
20     public static void main(String[] args) {  
21         FinalExample obj = new FinalExample();  
22         obj.displayMaxSpeed();  
23  
24         SubClass subObj = new SubClass();  
25         subObj.showDetails();  
26     }  
27 }  
28
```

	Test	Expected	Got	
✓	1	The maximum speed is: 120 km/h This is a subclass of FinalExample.	The maximum speed is: 120 km/h This is a subclass of FinalExample.	✓

Passed all tests! ✓

## Question 3

Correct

Marked out of 5.00

As a logic building learner you are given the task to extract the string which has vowel as the first and last characters from the given array of Strings.

Step1: Scan through the array of Strings, extract the Strings with first and last characters as vowels; these strings should be concatenated.

Step2: Convert the concatenated string to lowercase and return it.

If none of the strings in the array has first and last character as vowel, then return no matches found

input1: an integer representing the number of elements in the array.

input2: String array.

Example 1:

input1: 3

input2: {"oreo", "sirish", "apple"}

output: oreoapple

Example 2:

input1: 2

input2: {"Mango", "banana"}

output: no matches found

Explanation:

None of the strings has first and last character as vowel.

Hence the output is no matches found.

Example 3:

input1: 3

input2: {"Ate", "Ace", "Girl"}

output: ateace

**For example:**

Input	Result
3 oreo sirish apple	oreoapple
2 Mango banana	no matches found
3 Ate Ace Girl	ateace

**Answer:** (penalty regime: 0 %)

```

1 import java.util.Scanner;
2
3 public class VowelStringExtractor {
4
5     public static void main(String[] args) {
6         Scanner scanner = new Scanner(System.in);
7
8         // Step 1: Read the number of elements in the array
9         int n = scanner.nextInt();
10
11         // Step 2: Read the array of strings
12         String[] inputArray = new String[n];
13         for (int i = 0; i < n; i++) {
14             inputArray[i] = scanner.next();
15         }
16
17         // Step 3: Extract strings with vowels as first and last characters
18         String result = extractVowelStrings(inputArray);

```

```

18 String result = extractVowelStrings(inputArray);
19
20 // Step 4: Print the result
21 System.out.println(result);
22 }
23
24 private static String extractVowelStrings(String[] strings) {
25     StringBuilder concatenated = new StringBuilder();
26
27     for (String str : strings) {
28         if (isVowel(str.charAt(0)) && isVowel(str.charAt(str.length() - 1))) {
29             concatenated.append(str);
30         }
31     }
32
33     // Step 5: Return the result
34     return concatenated.length() > 0 ? concatenated.toString().toLowerCase() : "no matches found";
35 }
36
37 private static boolean isVowel(char ch) {
38     ch = Character.toLowerCase(ch); // Convert to lowercase for comparison
39     return ch == 'a' || ch == 'e' || ch == 'i' || ch == 'o' || ch == 'u';
40 }
41 }

```

	Input	Expected	Got	
✓	3 oreo sirish apple	oreoapple	oreoapple	✓
✓	2 Mango banana	no matches found	no matches found	✓
✓	3 Ate Ace Girl	ateace	ateace	✓

Passed all tests! ✓
